

Project Report

Course Code: INT301 Section: KE006 RegNumber: 11715459

Student Name: Gokula Prudhvi Kumar Yadav

Roll No: 23

TOPIC:

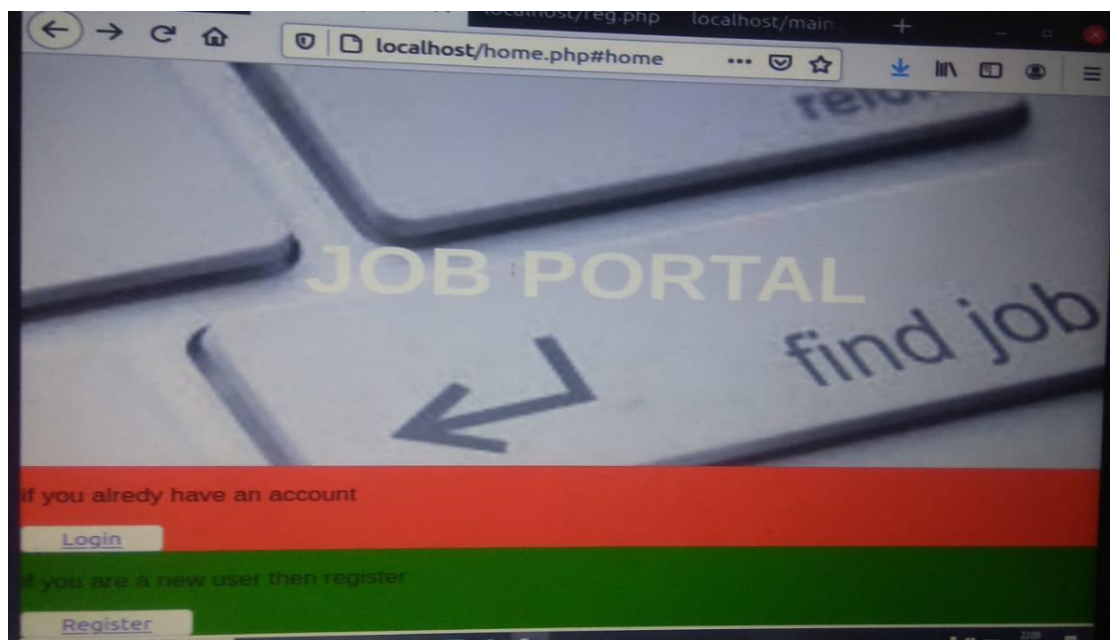

You are required to create a job portal. There should be only table in the backend which matches the job with the skill set. On the webpage, user will enter the skill set, it will match with the table and refers you the job.

Databases used:

I have uses two databases one **job.sql** which has the data of all jobs and the onther is **register.sql** which has all the data of the registered user in the job portal.

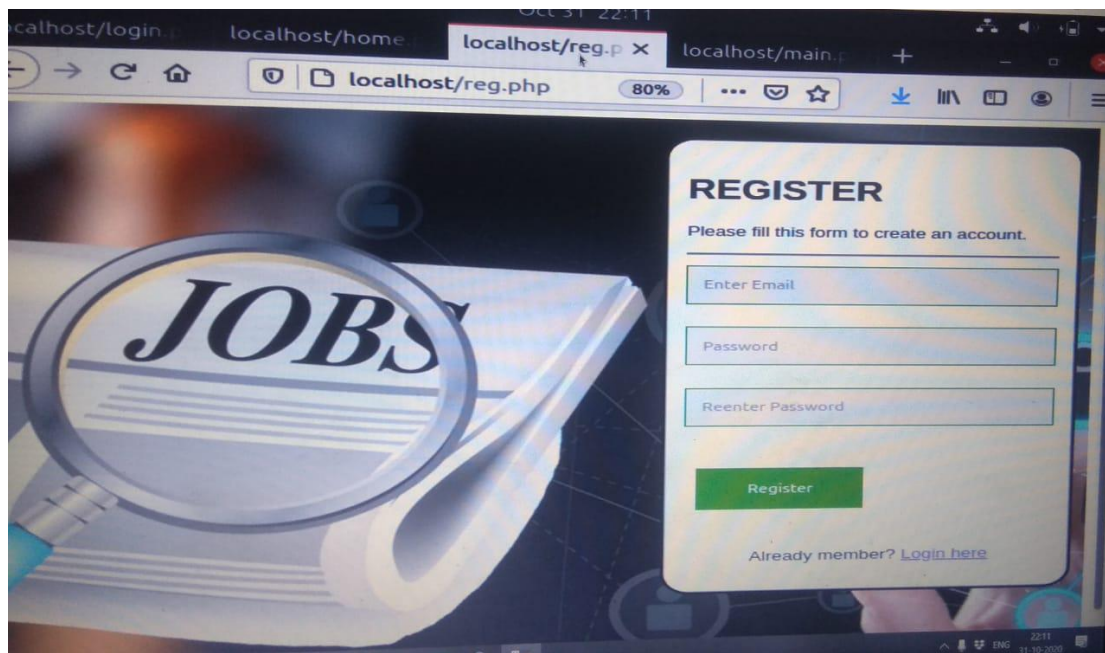

Pages:

1.HOME PAGE (home.php):

In home page we have 2 buttons on it if we already have a job portal account we can press on login button which will redirect to login page (**login.php**) if we don't have job portal account we can press on register button then it will redirect to register page(**reg.php**).

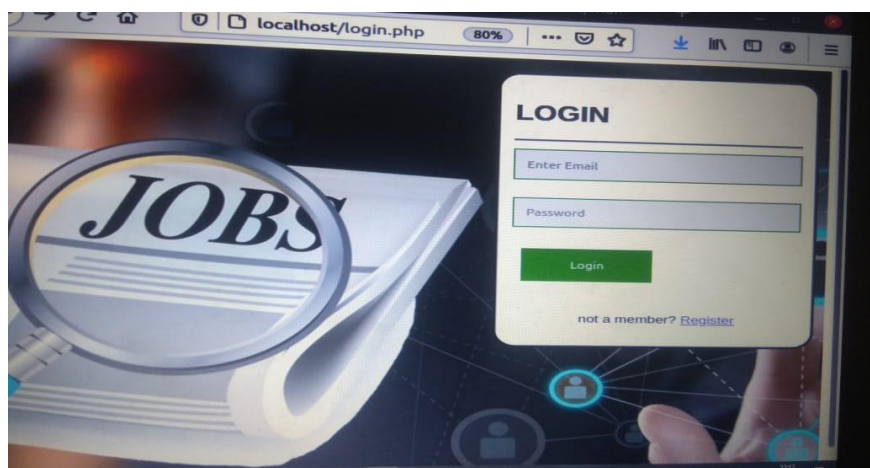

2.REGISTER PAGE(reg.php):

In this page user has to enter their email and any password of his choice to register.

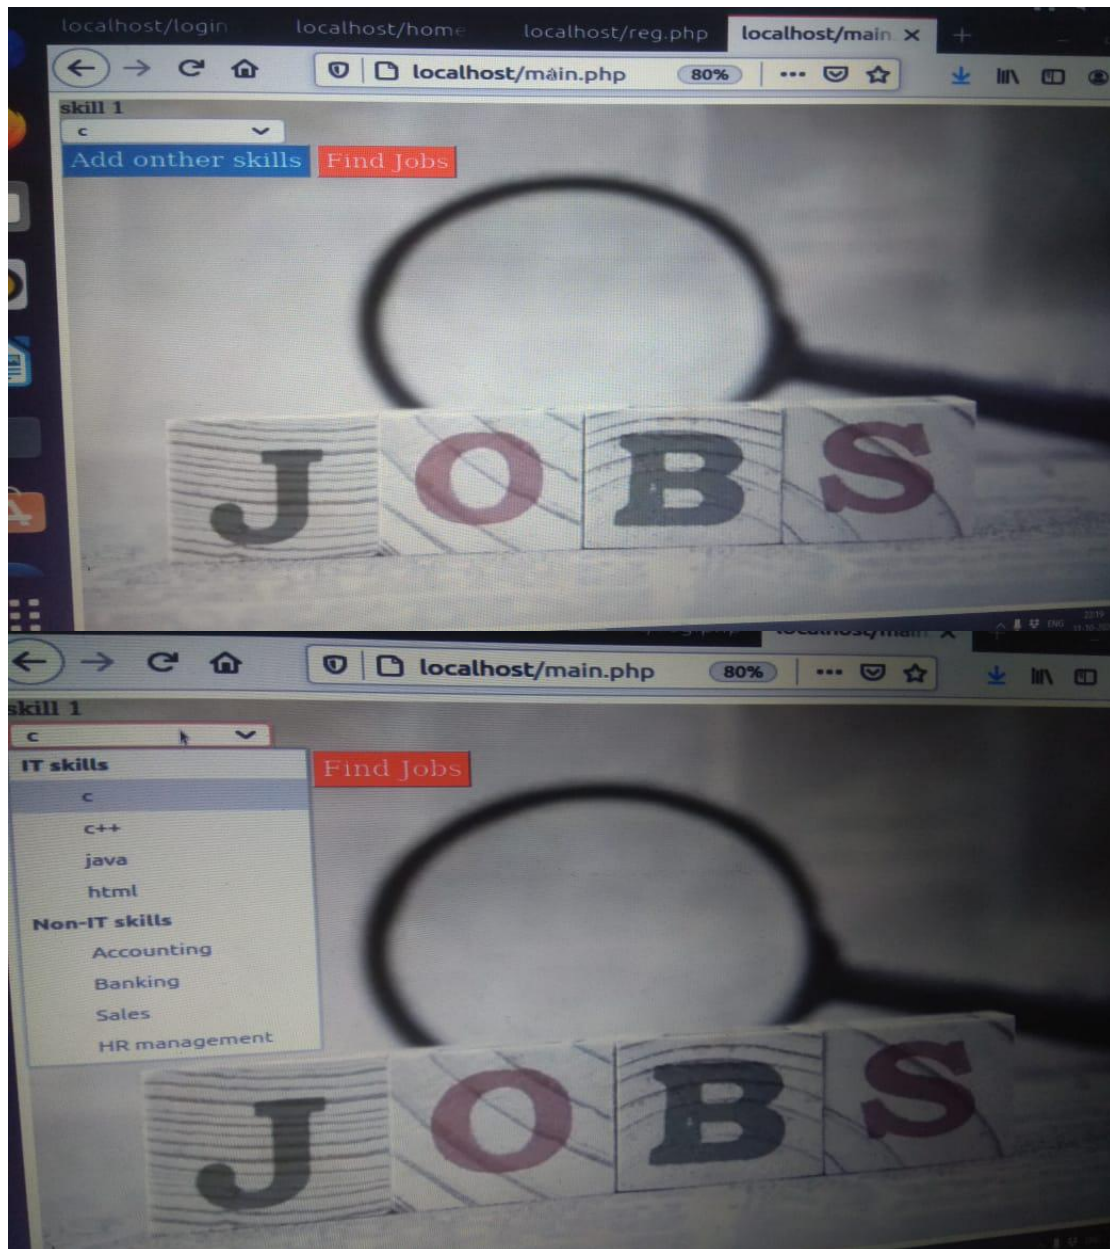

- ✓ i have set some min requirements for mailid while entering the mail like starting with any character or number after that @ should be included and next characters should be included and next Dot should be included and after dot 2 letters should be included.
- ✓ I have set some min requirement in password the password should have min 8 characters in which there should be at least one capital letter, one small letter, one digit and one special character.
- ✓ By pressing on the register button after entering the valid email and password (i.e. which satisfy the minimum requirements) it will redirect to login page or else if we already have an account we can directly press on login here it will redirect to login page.

Login page:

- ✓ In this page if the user already has a job portal account they enter their details and login through it while entering the mail I have set some minimum requirements because users may not include them in it. If we press on login after entering the correct details it will redirect to main.php page. If the details entered are not correct it asks to enter the correct details.

Main.php:

- ✓ We can select skills by selecting the option from the dropdown box.
- ✓ If we have more skills we press on add onther skills button and add more skills up to 10 skills max.

✓ If we press on the find jobs button after selecting the skills we redirect to result.php page in which we get the details of the jobs which satisfies the given skills like job name, company name, company number, company email, salary and location of the job in a tabular form.
